                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

RESULT 2

envelope protein gp120/gp41 - human immunodeficiency virus type 1 C;Species: human immunodeficiency virus type 1, HIV-1

A,Variety: isolate 27B C;Date: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 09-Jul-2004

C;Accession: \$21994; \$70421 R;Steuler, H.; Storch-Hagenlocher, B.; Wildemann, B.; Hacke, W. submitted to the EMBL Data Library, July 1991 A;Description: Distinct populations of HIV-1 in blood and cerebrospinal fluid as determir

A;Accession: S21994
A;Molecule type: DNA
A;Residues: 1-357 <STE1>

S21998
Circle protein gpl20/gp41 - human immunodeficiency virus type 1
Cispecies: human immunodeficiency virus type 1
Cispecies: human immunodeficiency virus type 1, HIV-1
A;Variety: isolate 28
Cispecies: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 09-Jul-2004
Cispeciesion: S21998; S70425
Ristenler, H.; Storch-Hagenlocher, B.; Wildemann, B.; Hacke, W.
Ristenler, H.; Storch-Hagenlocher, B.; Wildemann, B.; Hacke, W.
A;Bestription: Distinct populations of HIV-1 in blood and cerebrospinal fluid as determine A;Reference number: S21990
A;Accession: S21998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A Molecule type: DNA

A new hybrid polypeptide with enhanced pharmacokinetic properties comprises enhancer sequence.

Disclosure; Page 45; 124pp; English.

The invention relates to hybrid polypeptides comprising enhancer peptide sequence linked to core polypeptides. The enhancer polypeptides are derived from various retroviral envelope (1941) protein sequences, especially from HIV-1, HIV-2 and SIV. The enhancer peptides enhance the pharmacokinetic properties such as increasing the half-life of any core polypeptide that they are linked to. The core polypeptides are any polypeptide that may be introduced into a living system and that can function as a pharmacoligically useful peptide for the treatment or prevention of a disease. The core polypeptides are bloactive peptides selected from a growth factor, cytokine, differentiation factor, interferon, colony stimulating factor, hormone or anglogenic

peptidase or protease degradation. This minimises the need for more frequent, or even continual, administration of the peptides. AAB54784 to AAB55431 represent peptides used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)

```
The present invention describes a modified anti-viral peptide (I)

comprising a peptide that exhibits anti-viral activity and a reactive

comprising a peptide that exhibits anti-viral activity and a reactive

group which is reactive with amino groups, hydroxyl groups, or thiol

groups on blood components to forms stable covalent bonds. (I) has anti-

viral and anti-fusogenic activities. (I) inhibits viral infection of

cells by inhibiting cell-cell fusion or free virus infection or to reduce

cells by inhibiting cell-cell fusion or free virus infection or to reduce

the level of membrane fusion events between two or more entities, e.g.,

virus-cell or cell-cell, relative to the level of membrane fusion that

coccurs in the absence of the peptide. (I) is useful in the treatment of

patients who are suffering from viral infection, e.g. HIV, RSV, HBIV,

MeV, and SIV. (I) may be administreed prophylactically to previously

uninfected individuals. This is useful in cases where an individual has

components of the blood, such as immunoslobin, serum albumin, red

lived components of the activity is extended for days to weeks.

This is due to improved stability in vivo and a reduced susceptibility to
                                                                                                                                                                                                           ö
                     infection and can be used in anti-viral and anti-fusogenic treatments. Sequences AAY88651-Y90055 represent core polypeptide fragments that can be used in the invention. Some sequences among those indicated also comprise enhancer fragments at terminal ends and form hybrid polypeptides
  factor. The peptides of the invention can be used for inhibiting viral
                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Long lasting fusion peptide inhibitor; viral infection; antiviral; antifusgeant; moballe blood component; measles virus; MeV; SIV; sinian immunodeficiency virus; human parainfluenza virus; HPIV; RSV; human respiratory syncytial virus; human immunodeficiency virus; HIV.

The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a
reactive group (II) (e.g. succinimidy) and maleimido groups) attached to
a less therapeutically active amino acid region (IV), which covalently
bonds with amino/hydroxyl/thiol groups on blood components to form a
peptidase stabilised therapeutic peptide components to form a
(I) are useful for modifying therapeutic peptides e.g. hormones, growth
factors and neurotransmitters, to protect them from peptidase activity in
vivo for the treatment of various disorders. Endogenous therapeutic
peptides are not suitable as drug candidates as they require frequent
administration due to rapid degradation by peptidases in the body.
Modifying and attaching therapeutic peptides to albumin prevents or
reduces the action of peptidases to increase length of activity (half
life) and specificity as bonding to large molecules decreases
ABB90829 to AAB9241 represent peptides which can be used in the
exemplification of the present invention
                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                  Gaps

                                                                                                                                                                  The present sequence is a core polypeptide which may be linked to an enhancer peptide to form a novel hybrid polypeptide. The hybrid polypeptide exhibits enhanced pharmacokinetic properties relative to those exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide. The hybrid and core polypeptides can be used for modulating fusogenic events and intracellular processes involving coiled coil peptide interactions. Other uses include preventing, treating and/or diagnosing disorders involving fusion events (e.g. modulation of neurotransmitter exchange and sperme egg fusion), intracellular processes involving coiled-coil peptides (e.g. bacterial infections) and viral infections that involve cell-cell and/or virus, respiratory sprivial infections caused by human immunodeficiency virus, respiratory surginal coiled-coil beat virus, hepatitis B virus, Mason-Pfizer virus and polio virus). The enhancer peptide sequence increases the half-life and reduces the clearance rate of therapeutic peptides, which increases their efficacy and minimises the incidence and severity of adverse side

```

```
The present sequence is a core polypeptide which may be linked to an enhancer peptide to form a novel hybrid polypeptide. The hybrid polypeptide exhibits enhanced pharmacokinetic properties relative to those exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide. The hybrid and core polypeptides can be used for modulating fusogenic events and intracellular processes involving colledcoil peptide interactions. Other uses include preventing, treating and/or diagnosing disorders involving fusion events (e.g. modulation of neurotransmitter exchange and sperm-egg fusion), intracellular processes involving colled-coil peptides (e.g. bacterial infections) and viral infections caused by human immunodeficiency virus, respiratory syncytial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        virus, Epstein-Barr virus, hepatitis B virus, Mason-Pfizer virus and polio virus). The enhancer peptide sequence increases the half-life and reduces the clearance rate of therapeutic peptides, which increases their efficacy and minimises the increases the severity of adverse side effects. In addition, this increases the sensitivity of the diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Core polypeptide; enhancer; antiviral; anti-HIV; virucide; hepatotropic; antiinflammatory; hybrid polypeptide; coiled-coil peptide interaction; fusion-related disorder; bacterial infection; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New hybrid polypeptide, useful for preventing, treating and diagnosing e.g. viral infections, comprises an enhancer peptide linked to a core

Human immunodeficiency virus; HIV; respiratory syncytial virus; RSV;

Viral core polypeptide, SEQ ID NO: 1357.

(first entry)

(revised)

06-AUG-2003 03-JAN-2002

```
The invention relates to methods of generating immunogens that elicit

neutralising antibodies which target regions of viral envelope proteins

such as the gg120/gg41 (glycoprotein 120/glycoprotein 41) complex of HIV-

1 (human immunodeficiency virus 1). Sequences AAU70179-AAU70198 and

AAU70677-AAU70743 represent stabilising peptides modelling the alpha-

ca AAU70677-AAU70743 represent stabilising peptides modelling the alpha-

ca AAU70677-AAU70743 represent stabilising peptides modelling the alpha-

catabilise fusion-active intermediate structures, which can be used as

caccine immunogens. Immunogenic compositions comprise a viral envelope

catabilise fusion and entry, and optionally, a viral cell surface receptor or

control fusion and entry, and optionally, a viral cell surface receptor or

its fragment. The stabilising peptide is capable of associating with the

carvelope protein or its fragment to form a stabilised, fusion active

carvelope protein or its fragment to form a stabilised, fusion active

carvelope protein or its fragment to form a stabilised, fusion active

carvelope protein or its fragment to form a stabilised, fusion active

carvelope protein or its fragment to form a stabilised active

carvelope protein or its fragment to form a stabilised active

carvelope protein or its fragment are used to determine the ability of immunogen various forms of antibody response raised against HIV-1 gp41 domains. The sequences and

carvelope are useful for inhibiting HIV infection, for inducing an immune immune in an animal and for raising antibodies
                                                                                                                                                                                             Human, HIV-1, human immunodeficiency virus; gp41; glycoprotein 41; gp120;

The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 588-595 (heptad repeat region HR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with apptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in the specification. (Updated on 06-HUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human immunodeficiency virus; HIV; respiratory syncytial virus; RSV; virucide; heptad repeat region; transmembrane protein; gp41; HR1; HR2; infection.

The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-555 (heptad repeat region RR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV specification. The present sequence is a peptide provided in the specification. (Updated on 06-AUG-2003 to correct OS field.) (Updated on 11-SBP-2003 to street OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP178 complex.
                                                                                                                                                                                 Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anti-retroviral, DP178-like, DP107-like, transmembrane protein gp41; antifusogenic, antiviral, HIV transmission; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-LIAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides darived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV specification. The present sequence is a peptide provided in the specification. (Updated on 06-MUG-2003 to correct OS field.) (Updated on 11-SSP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                  Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human immunodeficiency virus, HIV, respiratory syncytial virus, RSV, virucide, heptad repeat region, transmembrane protein, gp41, HR1, HR2,

The present all products which exhibite control calls the present all present all presents are controlled to the control calls of the present all calls be petides. The peptides of the transmembrane protein gp41 from human calls 639-673 of the transmembrane protein gp41 from human calls 639-673 of the transmembrane protein gp41 from human calls saled to amino acids 538-595 of gp41 from HIV-LIAI. The phtide corresponds to amino acids 558-595 of gp41 from HIV-LIAI. The invention of a lor relates to a method of identifying compounds that inhibit the corresponds to amino acids 558-595 of gp41 from HIV-LIAI. The invention of correcting the formation of a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or beence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, cantivitied or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to unlinfected cells. The present sequence represents one of the DP178-like/DP107-like peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

            The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU1409) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-1LAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex. The method comprises absence of a test compound, in a reaction mixture containing DP107 and small molecule compounds, which may themselves exhibit antifusogenic, and invitate of interfall for interacellular modulatory activity. The DP178-like/DP107-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method of treating an HIV infection in an individual, which involves administering in combination a chemokine co derepetor 5 (CCR5) antagonist or its salt and a DP-178 polypeptide or its derivative. Other viral infections can also be treated using the method. The present sequence is a peptide derived from HIV and useful in the method of the invention
                                                                                                                                                                                                                                                                    peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents one of the DP178-like/DP107-like peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treatment of HIV infection in an individual involves administration of a combination of chemokine co-receptor five antagonist and a specified HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Viral infection; HIV; antiviral; DP-178; CCR5 antagonist; T-20; DP-107;

                                                                           RESULT 14
                                                                                                    The invention relates to a novel hybrid polypeptide comprising an enhancer peptide sequence linked to a core polypeptide. The enhancer peptide sequence comprises WGEWEGKI or WASLWEWF. The enhancer includes novel peptides that exhibit anti-fusogenic activity, antiviral activity and/or ability to modulate intracellular processes. The novel peptide sequence enhances pharmacokinetic properties of any core polypeptide, for example, a polypeptide useful for the treatment or prevention of a disease, or an imaging agent useful for imaging tructures in vivo. The novel polypeptide and hybrid polypeptides are useful for modulating fusogenic events and exhibit antifusogenic or antiviral activity. The novel hybrid polypeptide is useful for decreasing viral infection and modulating intracellular processes involving coiledcoil peptide interactions. The novel hybrid polypeptide comprises insulin or its fragment, so the core polypeptide is useful for ameliorating the symptoms of forms of diabetes. The novel hybrid polypeptide is also useful as a part of prognosis for preventing disorders including fusion the context and viral infection and modulating the preventing disorders including fusion useful as a part of prognosis for preventing disorders including fusion fevents and viral infection and including the context and viral infection and modulating coiledcover.
                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hybrid polypeptide for modulating fusogenic events for e.g. antiviral activity, has enhancer peptide sequence derived from retroviral envelope protein sequences linked to core polypeptide e.g. therapeutic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fusion, and for diagnosis and in vivo imaging methods. This sequence represents an enhancer peptide of the invention.

The invention relates to a novel hybrid polypeptide comprising an enhancer peptide sequence linked to a core polypeptide. The enhancer peptide sequence comprises WGEWEGKI or WASLWEWF. The invention also includes novel peptides that exhibit anti-fusogenic activity, antiviral activity and/or ability to modulate intracellular processes. The novel hybrid polypeptide has virucide and antidiabetic activity. The enhancer peptide sequence enhances pharmacokinetic properties of any core peptide sequence enhances plantamacokinetic properties of any core polypeptide, for example, a polypeptide useful for the treatment or prevention of a disease, or an imaging agent useful for imaging are useful for example, a polypeptide and hybrid polypeptides are useful for modulating fusogenic events and exhibit antifusogenic or antiviral activity. The novel hybrid polypeptide is useful for decreasing viral infection and modulating intracellular processes involving colleducing the refractions. The novel hybrid polypeptide is useful for amellorating the symptoms of forms of diabetes. The novel hybrid polypeptide is also events and viral infection that involves cell-cell and/or virus-cell infection, and for diagnosis and in vivo inmaging methods. This sequence represents an enhancer peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New hybrid polypeptide for modulating fusogenic events for e.g. antiviral activity, has enhancer peptide sequence derived from retroviral envelope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein sequences linked to core polypeptide e.g. therapeutic protein.

DECOUNTY

AB0101
```

The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective concentration of a peptide consisting of a region of 16.39 consecutive camino acids of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALLMOTIS.

107x178x4 or PLZIP sequence search motifs, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, or macromolecular carrier group, and group, hydrophobic group, or macromolecular carrier group, and chain of the virus to the cell is inhibited. The peptides were identified by analysing the structure/motifs present in the HIV-1 glycoprotein 41 anit-HIV peptides DPL07 and DP178. These heptad repeat motif containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic organisms and HIV isolates, looking for DPL07/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to a cell and Epstein-Barr virus infection. The present sequence is a control peptide used in the study of the DP178 stucture. (Updated on 23-correct) corrected on 23-correct organisms and HIV isolates, etclein the DP178 stucture. Example; Fig 1; 716pp; English.
